

FitBuddy AI — Non-Functional & Safety Requirements

Phase 2: Requirement Analysis

Technology requirements

- FastAPI/Uvicorn backend
- Jinja2 responsive frontend
- SQLite + SQLAlchemy
- Pydantic validation
- pytest automated tests

Safety boundaries

The README describes the project as a general-wellness software demonstration, not medical care. It avoids extreme dieting, rapid weight-loss targets, and unsafe exercise challenges.

Security requirements

API credentials and admin keys must remain private. The supplied documentation explicitly warns against committing .env to Git.
